## Abstracts

According to our (Global Info Research) latest study, the global Endoscopic Ultrasound Microprobe market size was valued at US\$ 981 million in 2025 and is forecast to a readjusted size of US\$ 1898 million by 2032 with a CAGR of 10.0% during review period.

The endoscopic ultrasound microprobe is a miniature medical device that combines endoscopy and ultrasound imaging technology. It enters the body's cavity (such as the digestive tract, bile and pancreatic duct, etc.) through the working channel of the endoscope and uses high-frequency ultrasound to generate high-resolution images to help doctors observe the deep structure of organs, the range of lesions, and the relationship with surrounding tissues. It is often used for tumor staging, diagnosis of submucosal lesions, and guidance of interventional treatment.

The endoscopic ultrasound microprobe market has grown steadily in recent years, mainly driven by advances in minimally invasive diagnostic technology and rising demand for early screening of digestive tract and bile and pancreatic duct diseases. At present, North America and Europe dominate, thanks to mature medical systems and the widespread use of high-frequency probe technology; the Asia-Pacific region (especially China and India) has become the fastest growing market due to its large population base, upgraded medical infrastructure and increased awareness of early cancer screening.

The competitive landscape is dominated by giants such as Olympus, Fujifilm, etc., which consolidate their advantages through technology iteration and mergers and acquisitions, while emerging companies focus on differentiated products (such as ultra-

thin bile and pancreatic duct probes, AI-assisted imaging systems). Future trends include:

Precision: miniaturization of probes (diameter
