An enema is a liquid or semi-solid pharmaceutical preparation administered rectally into the colon for bowel evacuation, cleansing, or local drug therapy. Its mechanism of action includes stimulating intestinal peristalsis, softening stool, or increasing water content in the intestinal lumen through osmotic effects, thereby facilitating defecation or delivering medication. Common forms include small-volume ready-to-use enemas and large-volume cleansing enemas.

Upstream includes active pharmaceutical ingredients such as glycerin, phosphates, and lactulose, as well as excipients, medical-grade plastic containers, and packaging materials. Downstream applications include hospitals, primary healthcare institutions, and retail pharmacy channels. The overall industry gross margin generally ranges from 40% to 70%, with higher margins for branded and prescription products.

Global enema production is projected to reach 700 million units by 2025, with an average price of \$2.2 per unit.
