According to our (Global Info Research) latest study, the global ENEPIG Chemicals market size was valued at US\$ 168 million in 2025 and is forecast to a readjusted size of US\$ 229 million by 2032 with a CAGR of 4.6% during review period.

ENEPIG refers to a surface treatment process in which nickel, palladium, and gold are sequentially deposited onto the copper layer of a printed circuit board (PCB) using a chemical method. It is a non-selective surface treatment process that achieves excellent electrical conductivity, corrosion resistance, and abrasion resistance on the PCB board through a 10-nanometer-thick gold plating layer and a 50-nanometer-thick palladium plating layer. The thickness of the copper layer directly affects these physical and aesthetic properties. CCPAP is currently the latest technology used in PCB prototyping.

The upstream sources mainly consist of metals such as nickel salts (e.g., nickel sulfate), palladium salts, and gold salts. ENEPIG is considered the 'gold standard' for high-reliability electronic product surfaces due to its excellent solderability, linearity, and good flatness. In 2025, global sales are projected to be approximately 15,200 tons, with an average market price of around \$10,700 per ton. The industry's gross profit margin is expected to be in the range of 35%-50%.

ENEPIG, compared to ENIG, has an additional palladium layer between the nickel and gold layers. This palladium layer acts as both a barrier layer and provides soldering and bonding capabilities. It further protects the nickel layer from corrosion and prevents the black pad issue that can occur with ENIG surface treatment, significantly improving the functionality and reliability of the product. With the gradual phasing out of traditional SnPb solder, terminal surface treatments must meet RoHS and other hazardous

substance restrictions while also being compatible with lead-free solder. ENEPIG is widely considered a RoHS-compliant, general-purpose lead-free surface treatment solution.
