Chemical nickel-palladium-gold equipment uses chemical processes to accurately deposit nickel, palladium, and gold alloy layers on the surface of the substrate, aiming to enhance its conductivity, corrosion resistance, wear resistance, and aesthetic appearance. The core of its working principle lies in redox and replacement reactions. By finely controlling the metal ion concentration, temperature conditions, and pH balance in the electrolyte, combined with strict control of current density and electroplating time, it ensures that a uniform and dense nickel, palladium, and gold alloy coating is formed on the substrate.
