According to our (Global Info Research) latest study, the global Energy Operation Management Platform market size was valued at US\$ 57732 million in 2025 and is forecast to a readjusted size of US\$ 117442 million by 2032 with a CAGR of 10.8% during review period.

An energy operation management platform is an intelligent platform that utilizes big data, artificial intelligence, the Internet of Things (IoT), and cloud computing technologies to centrally monitor, optimize scheduling, manage assets, and reduce carbon emissions from energy systems such as power, photovoltaic, energy storage, and industrial parks. It provides one-stop services for energy data collection, electricity purchase and sale, distribution operation and maintenance, and energy consumption control, helping to improve energy utilization efficiency and increase the returns on new energy assets.

The core functions of the energy operation management platform include data collection and monitoring, energy consumption analysis and statistics, optimized scheduling and load management, visual management, and alarm and fault diagnosis.

The global supply of energy operations management (O&M) platforms is primarily comprised of large industrial software vendors, OT/IT converged platform providers, and emerging companies focused on energy digitalization. Traditional automation and building energy management giants possess mature platform products and global implementation service networks, giving them an advantage in large industrial and commercial building scenarios. IT vendors leverage cloud computing and AI capabilities to provide energy data management and predictive analytics. Additionally, specialized

vendors focus on energy monitoring, optimized scheduling, and carbon management.

Demand for O&M platforms mainly comes from manufacturing plants, commercial real estate/large buildings, hospitals and campuses, data centers, and energy-intensive enterprises. These scenarios have a strong need for energy consumption transparency, cost optimization, and security and stability. Furthermore, with the integration of distributed energy resources, energy storage systems, and electric vehicle loads, the requirements for platform capabilities in grid dispatching and distributed energy resource management (DERMS/EMS) are further increasing. In particular, enterprises' efforts to achieve energy conservation and carbon reduction goals, green energy strategies, and ESG reporting systems are making O&M platforms a crucial tool for enterprise energy digital transformation.

The product and technology roadmap of O&M platforms has rapidly evolved from early single monitoring and reporting systems to real-time data acquisition, cross-system integration, intelligent analysis, and optimized scheduling. Core technology development includes edge device and sensor integration, IoT communication protocols, cloud architecture and big data platforms, AI/predictive models, load optimization algorithms, and visual decision support. The platform is gradually shifting from an 'energy supply view' to a 'supply and demand coordination and energy efficiency optimization view,' and strengthening its integration capabilities with enterprise systems such as building automation systems (BMS), manufacturing execution systems (MES), and asset management systems (EAM), driving energy operations from passive monitoring to proactive optimization and predictive maintenance.
