Abstracts

The global Energy Site Selection Tools Software market size is expected to reach \$ 510 million by 2032, rising at a market growth of 4.3% CAGR during the forecast period (2026-2032).

Energy site selection tools identify, evaluate, and screen potential locations for energy-related capital projects. These software products help companies plan a wide range of projects, including renewable energy assets, such as solar, wind, and battery storage, electric vehicle charging infrastructure, nuclear facilities, conventional power generation, and grid-related assets. Many platforms also support data centers and other large-load developments, which face similar siting, grid, and permitting constraints. Energy site selection tools provide purpose-built geospatial mapping and geographic information system (GIS) analysis for early-stage energy project site identification and due diligence. These capabilities enable teams to identify target regions, locate points of interconnection, assess land characteristics and resource potential, analyze environmental and permitting constraints, and review parcel and landowner data through desktop analysis.
