## Abstracts

According to our (Global Info Research) latest study, the global Energy Storage Cells Contact System (CCS) market size was valued at US\$ 642 million in 2025 and is forecast to a readjusted size of US\$ 1876 million by 2032 with a CAGR of 16.5% during review period.

Cells Contact System (CCS) is one of the core components of new energy battery packs. It consists of signal acquisition components (such as wiring harnesses, FPCFFC, etc.), plastic structural parts, and copper/aluminum busbars, connected into a single unit through processes such as thermoforming or riveting. This enables high-voltage series and parallel connection of battery cells, as well as battery temperature and cell voltage sampling. It is part of the Battery Management System (BMS) and can be used in new energy power batteries, energy storage batteries, and other fields. Energy storage Cells Contact System (CCS) is a key technology applied in energy storage systems. The main function of energy storage CCS is to centralize the energy output of energy storage devices (such as battery packs, supercapacitors, etc.) onto an integrated busbar for effective management and energy distribution. Energy storage battery connection systems are mainly used for current conduction, signal acquisition, and protection functions of energy storage battery modules, and are suitable for scenarios such as residential energy storage, commercial energy storage, peak-shaving energy storage, and mobile energy storage. In 2025, the global capacity of energy storage Cells Contact Systems (CCS) is projected to reach 18.74 million units, with an average price of approximately US\$33.28 per unit and a gross profit margin of approximately 26.86%. Kosen Technology has an annual CCS busbar capacity of 3 million units, while Huichuangda has an annual CCS module capacity of 12 million units. The upstream industry includes FPC/PCB manufacturers, copper and aluminum busbar

manufacturers, plastic structural component manufacturers, and equipment manufacturers.

With the increasing proportion of renewable energy sources (such as solar and wind power), energy storage systems have become a crucial guarantee for the stability and reliability of the power industry, driving the growth in demand for battery storage connection systems (CCS). Globally, governments are implementing green energy policies, providing subsidies and incentives, which has fueled the growth of the energy storage market. Continuous advancements in energy storage battery technology, connection systems, and battery management systems (BMS) have led to the gradual functional upgrades of CCSs, integrating more sensor functions such as voltage, temperature, and condition monitoring.

The prices of materials used in CCSs, such as copper and aluminum, fluctuate significantly, potentially affecting production costs and profits. Currently, the energy storage market lacks fully unified standards, and the technical requirements for battery storage connection systems (CCS) vary considerably across different regions and applications, increasing the complexity of product design and manufacturing processes. Energy storage battery systems typically require long-term stable operation, necessitating very high quality and reliability from CCSs, which places higher demands on product design, manufacturing processes, and material selection.

In the future, CCSs will further integrate more functions, such as battery monitoring, fault detection, and thermal management, enhancing the intelligence and automation levels of the products. With the increasing application of energy storage, especially grid-scale energy storage systems, the safety design of CCS (Continuous Computing System) will become more complex and must meet higher safety standards. Modular design will become the trend for energy storage CCS, making the product more adaptable to different energy storage systems, while also reducing product maintenance and replacement costs.
