According to our (Global Info Research) latest study, the global Engine Cylinder Head Cover market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The cylinder head cover is not a valve cover. The cylinder cover is a cover on the engine block, which can prevent external impurities from entering the engine and also play a role of sealing. Covers and seals the cylinder head, keeping oil inside and contaminants like dirt and moisture out.

The first and most basic function is to cover and seal the cylinder head, keeping the oil inside while keeping contaminants such as dirt and moisture out. This may sound simple, but it's often the hardest aspect to get right. The second function of the cylinder head cover is to isolate the engine oil from the air. Oil mist forms during engine operation. The cooler inner surface of the cylinder head cover can collect oil mist, causing the oil to condense and flow downward back into the oil sump. The cylinder head cover is also responsible for crankcase ventilation. As the piston moves in the cylinder, pressure builds up inside the engine. If left alone, this pressure can cause individual seals to leak, causing the engine to become less efficient. To avoid this, use a tube to connect the cylinder head cover to the intake tract for combustion ventilation air. The pipe can be connected using grooved hose couplings, threaded pipe couplings or quick-disconnect couplings. The oil baffle or filter in the cylinder head cover is used to minimize the flow of oil into the intake passage. Another function of the cylinder head cover is to serve as the oil filler port. This structure can be as simple as a hole in which the oil filler cap is screwed; it can also be a more complex oil filler pipe. The cylinder head cover also serves as a mount for sensors, including camshaft position and

camshaft timing sensors. Of course, whether these sensors are included depends on the complexity of the engine.
