## Abstracts

The global Engine Decarbonization Service market size is expected to reach \$ 1410 million by 2032, rising at a market growth of 5.3% CAGR during the forecast period (2026-2032).

To address problems such as power reduction, decreased fuel efficiency, and excessive emissions caused by carbon buildup in engines during long-term operation, engine decarbonization services have emerged. With the development of automotive technology and increasingly stringent environmental regulations, this service has gradually become a crucial aspect of vehicle maintenance since the beginning of the 21st century. Currently, it has developed into a professional service encompassing multiple technological approaches, including fuel additive cleaning, hydrogen-oxygen decarbonization, walnut shell blasting, and specialized physical and chemical cleaning equipment. It is widely used in traditional fuel vehicle maintenance, performance restoration, used car preparation, and exhaust gas treatment, effectively removing carbon deposits, restoring engine efficiency, extending service life, and reducing harmful emissions.

The industry will evolve towards 'precision, ecological sustainability, and intelligence.' In terms of technological breakthroughs, carbon-neutral fuel synthesis, intelligent diagnostic systems, and multi-platform independent control will become new growth points. From a social value perspective, engine decarbonization services are not only an environmental protection measure but also a key technology for improving engine performance and reducing exhaust emissions, building a healthy ecosystem of harmonious coexistence between people, vehicles, and the environment through professional capabilities and humanistic care. Policy recommendations include improving carbon footprint accounting standards, establishing a decarbonization technology certification system, and promoting green finance support to achieve sustainable industry development.
