## Abstracts

According to our (Global Info Research) latest study, the global Engine Emissions Testing market size was valued at US\$ 1137 million in 2025 and is forecast to a readjusted size of US\$ 1713 million by 2032 with a CAGR of 6.1% during review period.

Engine emission testing refers to the process of measuring and evaluating pollutant emissions from internal combustion engines (gasoline, diesel, natural gas, or alternative fuel engines) through laboratory bench testing or real-world operating condition testing. Its core purpose is to verify whether engine emissions under different operating conditions comply with environmental regulations (such as Euro, EPA, China VI, etc.) and is used for engine R&D optimization, type approval, production conformity checks, and in-use monitoring. Testing typically focuses on key pollutants such as NO<sub>x</sub>, CO, CO<sub>2</sub>, HC, and PM/PN, while also evaluating fuel economy and emission control system performance.

Increasing concerns about air quality and environmental sustainability have led to stricter emission regulations for both vehicle and industrial engines. Governments and regulatory bodies worldwide are imposing more stringent emission standards, driving the demand for accurate and reliable emissions testing equipment. The automotive industry's shift toward electric and hybrid vehicles, as well as the exploration of alternative fuels, is influencing the emissions testing market. Testing methods and equipment are adapting to assess emissions from these new powertrain technologies.
