According to our (Global Info Research) latest study, the global Engineering Cost Software market size was valued at US\$ 348 million in 2024 and is forecast to a readjusted size of USD 1634 million by 2031 with a CAGR of 25.0% during review period.

Cost engineering software is a tool specifically used for cost management, budgeting, and quotation analysis in construction and engineering projects. It helps cost engineers and project managers accurately calculate the materials, labor, and equipment costs required for a project through digital and automated means, and generate detailed cost estimation reports. Common functions include budget management, progress tracking, bill of materials, and contract management, which can significantly improve work efficiency, reduce error rates, and ensure that project costs are within budget. This type of software is widely used in fields such as construction, infrastructure, and civil engineering, and supports accurate project cost planning and control.

As a key tool for modern construction and engineering project management, construction cost software has greatly improved the efficiency and accuracy of cost management. Through automated calculations and data integration, cost software can reduce errors in manual operations and ensure that project budgets are more accurate and controllable. Compared with traditional manual calculations, construction cost software not only saves time, but also updates costs, material prices and market data in real time, allowing cost engineers to quickly adjust budgets to respond to project changes. In addition, many cost software also have functions such as contract management, cost tracking, and progress analysis to help project managers effectively control costs throughout the project life cycle. Therefore, construction cost software has become an indispensable tool in the industry, promoting the digitalization and

intelligentization of engineering management.
