According to our (Global Info Research) latest study, the global Engineering Solid Tires market size was valued at US\$ 1547 million in 2025 and is forecast to a readjusted size of US\$ 2166 million by 2032 with a CAGR of 4.8% during review period.

In 2025, global Engineering Solid Tires production reached approximately 4.30 million units?with an average global market price of around US\$ 350 per unit.

Engineering solid tires refer to non-pneumatic tires used on construction machinery, industrial vehicles and special-purpose working equipment. They are typically made from high-strength rubber compounds, steel rims or integrated composite structures, and do not rely on compressed air for load support. As a result, they offer strong advantages in puncture resistance, blowout prevention, low maintenance and high load-bearing performance. Compared with conventional pneumatic off-the-road tires, engineering solid tires are better suited for low-speed, heavy-duty and harsh operating environments where broken stones, metal scrap, glass, slag or other sharp objects are common. Major product types include skid steer solid tires, aerial work platform solid tires, loader solid tires, port vehicle solid tires, and heavy-duty solid tires for mining, steel mills and scrap yards. Structurally, they can be divided into press-on solid tires, resilient solid tires, aperture or cushion solid tires, and heavy-duty engineering solid tires.

he upstream segment of the engineering solid tire industry mainly consists of natural rubber, synthetic rubber, carbon black, silica, steel rims, steel wire, adhesives, anti-aging agents, vulcanizing agents and other rubber additives. Among these inputs, rubber formulation, wear-resistant materials and rim quality have a direct impact on tire

life, load capacity and impact resistance. The midstream segment includes tire design, rubber mixing, calendaring, molding, vulcanization, rim assembly and quality inspection. Key technical capabilities are reflected in compound formulation, tire body structure, heat dissipation, tear resistance and dimensional stability. Downstream applications include forklifts, skid steer loaders, wheel loaders, aerial work platforms, port tractors, airport vehicles, steel mill vehicles, mining support vehicles and scrap recycling equipment. Sales channels cover original equipment manufacturers, tire distributors, equipment rental companies, maintenance and replacement markets, and end industrial customers. Because solid tires are highly application-specific, leading suppliers usually develop different compounds and tread patterns for high-wear, non-marking, heat-resistant, low-vibration, anti-static and heavy-duty applications.

The growth of the engineering solid tire market is mainly driven by three factors. First, the expansion of warehousing, logistics, manufacturing and port automation is increasing the installed base of forklifts, material handling vehicles and port equipment. Second, the development of urban construction, rental equipment, aerial work platforms and compact construction machinery is creating additional demand for maintenance-free tires on skid steer loaders, scissor lifts, boom lifts and related machines. Third, mining, steel mills, scrap yards, waste treatment and recycling industries continue to require puncture-resistant, high-load and long-life tires for harsh operating environments. Although engineering solid tires are generally more expensive than pneumatic tires and have limitations in ride comfort and high-speed performance, they can reduce downtime, extend service life and lower maintenance costs in demanding applications. Future market development is expected to move toward higher-end and more customized products. Non-marking tires, heat-resistant tires, aperture cushion tires, low rolling-resistance tires and solid tires designed for electric industrial vehicles are likely to become key growth areas. Continental's recent expansion of solid tire offerings for telehandler applications also shows that major manufacturers are strengthening their focus on engineering and material handling use cases.
