The global Engineering Thermoplastics PA6 and PA66 market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Nylon is a linear thermoplastic, also known as Polyamide. It is a strong, high-performance, engineering plastic with excellent tensile strength, often seen as an alternative to silk, rubber, and latex. It is a commonly used thermoplastic material for various applications like clothing, rubber components like tires, ropes, threads, automobile parts, mechanical components, etc.

It is also referred to by its chemical name – PA (e.g., PA6, PA66)

PA6 and PA66 denote nylon 6 and nylon 66, respectively. The key difference between PA6 and PA66 is that PA6 is derived from a diamine, whereas PA66 is derived from diamine and diacid. “6” means that the material is conceived with a single monomer in combination with itself. In comparison, “66” shows that the material is developed from multiple monomers combined with itself (also called comonomers). The two most commonly known and used Nylon types are PA66 (Nylon 66) and PA6 (Nylon 6). They are often extruded to be used in the textile and packaging industries.
