Enteric methane mitigation additives are substances added to livestock feed to reduce the amount of methane produced during digestion, particularly by ruminants like cows and sheep. Methane is generated as a byproduct of microbial fermentation in the animals' stomachs, especially in the rumen, and is a significant contributor to agricultural greenhouse gas emissions. These additives work by altering the gut microbiota or fermentation processes to reduce methane output without harming the animals' health or productivity. Common types include nitrates, fats, essential oils, tannins, and synthetic compounds like 3-NOP (3-nitrooxypropanol), which has shown strong effectiveness in reducing emissions.
