Abstracts

The global Enteromorpha Compressa Extract market size is expected to reach \$ 718 million by 2032, rising at a market growth of 9.9% CAGR during the forecast period (2026-2032).

Ulva prolifera extract refers to a mixture of natural active ingredients obtained from marine green algae Ulva prolifera through processes such as water extraction, enzymatic hydrolysis, or supercritical fluid extraction. It is rich in polysaccharides (such as sulfated polysaccharides), amino acids, minerals, and polyphenols, and possesses moisturizing, antioxidant, soothing, and certain bioactive regulatory effects. It is widely used in functional skincare products, health foods, and marine biological resource development.

The Ulva prolifera extract industry chain mainly consists of upstream raw material acquisition (nearshore Ulva prolifera harvesting, cultivation, and preliminary drying), midstream extraction and processing (obtaining active ingredients such as sulfated polysaccharides through processes like water extraction, enzymatic hydrolysis, and membrane separation, followed by standardization), and downstream applications (functional skincare products, health foods, feed additives, and agricultural biostimulants, etc.). Upstream production is affected by seasonal outbreaks and resource distribution, resulting in lower added value and gross profit margins typically between 10% and 25%. Midstream extraction and processing, involving the enrichment and purification of active ingredients, possesses certain technological barriers, leading to gross profit margins generally between 30% and 60%. Downstream brands and formulations, leveraging functional claims and channel advantages, can achieve gross profit margins of 50% to 80%. Overall, the industry presents a typical marine biological extract industry structure of 'resource-driven + technology-driven extraction value-added

+ terminal brand premium.'

In 2025, the average price of *Ulva prolifera* extract was US\$60 k/ton, with sales volume reaching 6,016 tons, and the total production capacity of *Ulva prolifera* extract in 2025 was 8,600 tons.

As an important branch of marine biological resource development, *Ulva prolifera* extract embodies a typical path of 'high-value utilization of marine waste biological resources.' Its core value lies in transforming seasonally occurring *Ulva prolifera* blooms along the coast (originally a burden on environmental governance) into functional raw materials rich in sulfated polysaccharides, amino acids, and minerals, showing potential applications in skincare, food, and agriculture. From an industry perspective, its advantages lie in the wide availability of raw materials, relatively low cost, and the 'natural marine source' label, which helps align with the current trends of green sustainability and pure beauty. However, it also faces challenges such as insufficient stability of active ingredients, low standardization, and inadequate validation of high-end efficacy. Future development hinges on improving extraction and purification technologies, establishing a clear functional evaluation system, and extending into high-value-added applications (such as medical aesthetic raw materials and bioactive polysaccharides), thereby upgrading from a 'resource-utilizing product' to a 'functional high-end raw material.'
