Abstracts

According to our (Global Info Research) latest study, the global Enterprise AI Agent Platform market size was valued at US\$ 8129 million in 2025 and is forecast to a readjusted size of US\$ 97815 million by 2032 with a CAGR of 42.0% during review period.

Enterprise AI Agent Platform is an enterprise software platform used to build, deploy, orchestrate, govern, and operate AI agents for organizational workflows. It typically consists of large language model access layers, agent development studios, task planning engines, tool-calling interfaces, enterprise data and knowledge connectors, workflow orchestration modules, access management, safety guardrails, audit logs, evaluation tools, and observability components. The platform enables enterprises to package customer service, sales, IT operations, software development, data analytics, finance, human resources, procurement, supply chain, and compliance workflows into tasks that can be executed or assisted by AI agents. Depending on application complexity, it can be deployed as single-agent systems, multi-agent collaboration systems, embedded enterprise application agents, or vertical industry agents. Major commercialization regions include the United States, China, Europe, Japan, India, Israel, and South Korea, with typical customers including large enterprises, mid-market enterprises, cloud service providers, enterprise software vendors, system integrators, and regulated-industry clients.

Enterprise AI Agent Platforms are becoming a core infrastructure layer for enterprise generative AI implementation, with market opportunities driven by the shift from content generation to task execution and workflow automation. Compared with traditional chatbots or point automation tools, AI agent platforms connect model capabilities,

enterprise data, business systems, and access governance, enabling AI to move beyond answering questions into data retrieval, tool invocation, solution generation, process execution, and continuous result tracking. As cloud providers, enterprise software vendors, automation companies, and vertical AI firms continue to launch agent studios, agent orchestration engines, enterprise connectors, and security governance modules, customer service, IT operations, sales operations, software development, data analytics, and back-office management are becoming the earliest large-scale deployment scenarios.

The main market challenges are reliability, security, compliance, and cost control. When deploying AI agents, enterprises need to manage hallucinated outputs, incorrect tool calls, excessive permissions, unclear business accountability, data leakage, insufficient audit trails, and volatile model usage costs. As a result, procurement decisions are no longer focused only on model capability, but increasingly emphasize platform governance, explainable workflows, human-in-the-loop control, permission isolation, private deployment, and continuous evaluation. Future downstream demand is expected to expand from customer service and office assistants to financial risk control, compliance review, supply chain planning, finance shared services, procurement management, research and development engineering, and industry-specific knowledge workflows. Platforms with deep system integration, stable orchestration, and enterprise-grade security capabilities are more likely to secure long-term subscription revenue and strong customer retention.
