## Abstracts

The global Enterprise Energy Consumption and Carbon Emissions Management Software market size is expected to reach \$ 864 million by 2032, rising at a market growth of 11.5% CAGR during the forecast period (2026-2032).

Enterprise Energy Consumption and Carbon Emissions Management Software is a digital platform that integrates functions for energy consumption monitoring, carbon emissions accounting, data analytics, and emissions reduction management. By interfacing with internal data sources—such as smart meters, production equipment, and ERP systems—the software automatically collects consumption data for various energy types, including electricity, natural gas, steam, and fuel. It then converts this energy consumption data into carbon emission figures, adhering to national or international carbon accounting standards (such as IPCC guidelines, ISO 14064, and methodologies established by the National Development and Reform Commission). Building upon this foundation, the software offers features such as data visualization dashboards, carbon footprint tracking, emissions reduction goal management, carbon asset management, and automated report generation. These capabilities enable enterprises to monitor the carbon emissions status of both their own operations and their supply chains in real time, identify potential opportunities for energy conservation and carbon reduction, and provide the necessary data support and scientific basis for regulatory compliance, participation in carbon trading, and strategic decision-making regarding green transformation—all within the context of achieving carbon peaking and carbon neutrality goals.
