## Abstracts

The global Enterprise Resource Planning market size is expected to reach \$ 75060 million by 2032, rising at a market growth of 5.5% CAGR during the forecast period (2026-2032).

Enterprise resource planning (ERP) is a method of efficiently utilizing people, hardware and software to increase productivity and profit, thus simplifying a company's business processes. ERP systems merge each of the company's key operations, including the manufacturing, distribution, financial, human resources and customer relations departments, into one software system. It is widely used in all industries.

One of the primary drivers for ERP adoption is the desire to improve efficiency and productivity across different departments. ERP systems integrate various business processes and data into a single platform, reducing manual data entry and improving workflow automation.

The increasing adoption of innovative and advancing technologies, broadening the value of existing ERP systems, minimizing third-party dependencies, more highly secured resources, advancing financial systems, and other Notable factors are driving up the demand for ERP software, especially cloud-based.

Companies seek to reduce operational costs by implementing ERP systems. These systems can help in inventory optimization, resource allocation, and better procurement practices, ultimately leading to cost savings.

As businesses expand globally, they need tools that can support their international operations. ERP systems can handle multi-currency transactions, multiple languages,

and compliance with international accounting standards.
