## Abstracts

According to our latest research, the global Enzymatic Plastic Degradation market size will reach USD 157 million in 2031, growing at a CAGR of 16.5% over the analysis period.

Enzymatic plastic degradation refers to the biological process by which certain enzymes break down plastic materials into simpler, less harmful components. Unlike traditional physical or chemical recycling methods, enzymatic degradation leverages specific enzymes produced by microorganisms, such as bacteria and fungi, which can metabolize plastics like polyethylene and PET (polyethylene terephthalate). These enzymes act as catalysts to degrade the plastic polymers, reducing them to smaller molecules that can be further broken down or assimilated by the environment. This process offers a potentially sustainable solution to the growing issue of plastic waste, as it can lead to more efficient and eco-friendly recycling and disposal methods, while mitigating the environmental impact of plastic pollution.
