Abstracts

Enzyme linked immunospot technique is a more sensitive detection method in cellular immunology research. It can detect antibody secreting cells (ASC) and cytokine secreting cells (CK) at the single cell level. It is more sensitive than ELISA and limited dilution methods. It can detect one cell secreting the protein from 200000 to 300000 cells. In addition, this method can detect the function of living cells stimulated by antigen, with high specificity, high visual reliability, and easy operation. It has been widely used in the detection of CK secreting cells or ASC detection, and has been widely used in the immunology community at home and abroad.
