Enzyme replacement therapy (ERT) drugs for Gaucher disease are specialized treatments that provide patients with synthetic forms of the enzyme glucocerebrosidase, which is deficient or absent in those affected by the condition. By administering these recombinant enzymes intravenously, ERT aims to reduce the accumulation of glucocerebroside in the body, alleviating symptoms such as organ enlargement, bone pain, and hematological issues.

The development trend of enzyme replacement therapy (ERT) drugs for Gaucher disease has been marked by advancements in biopharmaceutical technologies, leading to more effective and safer treatments. Recent innovations include the development of modified recombinant glucocerebrosidase formulations that enhance enzyme stability, bioavailability, and tissue targeting, thereby improving patient outcomes. Additionally, research is exploring combination therapies and adjunct treatments that may further optimize ERT efficacy.
