According to our (Global Info Research) latest study, the global EP Catheter Ablation market size was valued at USD 1380.2 million in 2023 and is forecast to a readjusted size of USD 2731 million by 2030 with a CAGR of 10.2% during review period.

Electrophysiology (EP) is the study of the mechanism, function and performance of electrical signaling pathways that guide the functioning of the heart. EP study is a procedure that is performed to diagnose arrhythmias by locating areas of heart tissue that interrupt the normal functioning of the heart's electrical system. During an EP study, the electrophysiologist inserts several long, flexible tubes with wires, called catheters, into the heart to record electrical activity within the heart chambers and to detect abnormal electrical pathways. The second part of the test involves electrical stimulation of various parts of the heart to induce an abnormal heart rhythm. This helps the electro physiologist in treatment mapping, which could involve surgical removal of the abnormal tissue in the heart using a catheter.
