## Abstracts

According to our (Global Info Research) latest study, the global EPE Film Extrusion Lines market size was valued at US\$ 142 million in 2025 and is forecast to a readjusted size of US\$ 259 million by 2032 with a CAGR of 9.5% during review period.

EPE film extrusion production lines are key equipment for manufacturing photovoltaic encapsulation materials, primarily used to produce multi-layer co-extruded EVA-POE-EVA (EPE) composite encapsulation films. This production line utilizes multi-layer co-extrusion technology to form polymer materials with different properties in a single process, combining casting/blown film formation, cooling and shaping, online thickness control, and automatic winding processes to achieve high uniformity and stability in encapsulation film production. EPE film possesses excellent adhesion, resistance to moisture and heat, and anti-PID properties, making it widely used in the encapsulation of N-type battery modules and double-glass photovoltaic modules. Therefore, this type of extrusion line holds a crucial position in the photovoltaic material equipment chain. The global EPE film extrusion production line market size is projected to be around US\$138 million in 2025, with annual sales of approximately 394 sets and an average unit price of approximately US\$350,000. The segmented market is expected to continue growing at a CAGR of 9.7%, and the gross profit margin of EPE film extrusion production line equipment manufacturers is generally in the range of 15%–30%. The upstream of an EPE film extrusion production line mainly includes high-performance polymer raw materials such as EVA and POE, as well as formulation materials such as flame retardants, crosslinking agents, and light stabilizers. It also includes key equipment components such as high-precision co-extrusion screws, dies, cooling rollers, online thickness control, and automatic winding systems. The performance of the raw materials and the precision of the equipment directly determine the adhesion,

moisture and heat resistance, PID resistance, and yield of the encapsulation film. The downstream mainly consists of photovoltaic module manufacturers. EPE co-extruded encapsulation films are used as the encapsulation layer for N-type and double-glass modules. As modules develop towards higher efficiency and longer lifespan, the requirements for the weather resistance and reliability of encapsulation materials are constantly increasing, driving the growth in demand for EPE films and thus stimulating continuous investment and upgrades in high-end co-extrusion equipment.
