Abstracts

According to our (Global Info Research) latest study, the global Epichlorohydrin market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

Epichlorohydrin (ECH) is a clear colorless liquid with an irritating chloroform-like odor. It is a highly reactive organochlorine compound and is used in the production of glycerol, plastics, epoxy glues and resins, and elastomers. In contact with water, epichlorohydrin hydrolyzes to 3-MCPD, a carcinogen found in food. Epichlorohydrin is readily biodegradable and is not expected to persist in the environment. Epichlorohydrin has a low potential to bioaccumulate, and is not expected to adsorb to soil or sediment. In water, epichlorohydrin will be rapidly broken down by both biological and non-biological mechanisms. In air, epichlorohydrin will rapidly dissipate and break down. In the case of soil exposure, epichlorohydrin will mostly remain in groundwater rather than soil particulates, and will be rapidly degraded.

ECH was first described in 1848 and was isolated during studies on reactions between glycerol and gaseous hydrogen chloride.

ECH is classified by several international health research agencies and groups as a probable or likely human carcinogen in humans. Prolonged oral consumption of high levels of epichlorohydrin could result in stomach problems and an increased risk of cancer.

World of Epichlorohydrin production presents two characteristics: one is less production countries and regions, and regional development imbalance, China, the United States, Germany, Japan and China's China Taiwan region total production capacity of more

than 85% of the world's total production capacity. The second is capacity more concentrated, and the world more than 50% of capacity is concentrated in Dow (Dow) chemistry, Shandong Haili, Solvay (Solvay), Formosa Plastics and other minority several companies.
