Abstracts

Epidermal Growth Factor (EGF) is a growth factor that stimulates cell growth, proliferation, and differentiation by binding to its receptor EGFR. Human EGF is a 6045-Da protein with 53 amino acid residues and three intramolecular disulfide bonds. EGF results in cellular proliferation, differentiation, and survival. EGF considerably increases skin cell regeneration. More precisely, they can directly communicate to the skin cells to produce more collagen and elastin that is why most skin care makers use EGF to care our skin.
