## Abstracts

According to our (Global Info Research) latest study, the global Epitaxial Reactor market size was valued at USD 1322.9 million in 2023 and is forecast to a readjusted size of USD 2244.8 million by 2030 with a CAGR of 7.8% during review period.

Epitaxial has been a primary application of Chemical Vapor Deposition (CVD). In semiconductor manufacturing, epitaxial processes are used to produce the perfect crystal layers needed to manufacture semiconductor devices, to deposit crystal films with the designed electrical properties or to modify the mechanical properties of the substrate to enhance its electrical conductivity.

The epitaxially grown new single crystal layer can be different from the substrate in terms of conductivity type, resistivity, etc., and can also grow multi-layer single crystals with different thicknesses and different requirements, thereby greatly improving the flexibility of device design and device performance. The epitaxial process is also widely used in PN junction isolation technology in integrated circuits and in improving material quality in large-scale integrated circuits.

The core of an epitaxial (epi) reactor is the reaction chamber, typically made of quartz. Inside the chamber a holder for the silicon substrates, typically made of graphite coated with silicon carbide, is heated up to 900-1250°C while gases flow inside. These gases contain a volatile silicon compound and some dopant compounds carried by a chemical reducing or inert main gas flow.

The main epitaxial reactor manufacturers in the market include AIXTRON, Advanced Micro and Veeco, etc. The global top 3 companies account for nearly 60% of the

market, and the overall market concentration is high.

The main consumer countries of epitaxial reactors are the United States, China, Japan, South Korea and other countries and regions where the technology and semiconductor industry are well developed and invested heavily. These regions account for more than 50% of the global market.
