Abstracts

According to our (Global Info Research) latest study, the global Epitaxial Wafers market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Epitaxy is a method used to grow or lay a single crystalline film or layer over a crystalline-based semiconductor surface or substrate. The deposited substance must have a definite acclimatization with regard to the crystal-based semiconductor substrate. Moreover, Chip developers applies either molten or vapor based foundations to produce such epitaxial over layers. An epitaxial wafer is a wafer of semiconducting substrate made by epitaxial growth for application in microelectronics, photovoltaics and photonics.

Following a strong growth of 26.2 percent in the year 2021, WSTS revised it down to a single digit growth for the worldwide semiconductor market in 2022 with a total size of US\$580 billion, up 4.4 percent. WSTS lowered growth estimation as inflation rises and end markets seeing weaker demand, especially those exposed to consumer spending. While some major categories are still double-digit year-over-year growth in 2022, led by Analog with 20.8 percent, Sensors with 16.3 percent, and Logic with 14.5 percent growth. Memory declined with 12.6 percent year over year. In 2022, all geographical regions showed double-digit growth except Asia Pacific. The largest region, Asia Pacific, declined 2.0 percent. Sales in the Americas were US\$142.1 billion, up 17.0% year-on-year, sales in Europe were US\$53.8 billion, up 12.6% year-on-year, and sales in Japan were US\$48.1 billion, up 10.0% year-on-year. However, sales in the largest Asia-Pacific region were US\$336.2 billion, down 2.0% year-on-year.
