Epitaxy is a method used to grow or lay a single crystalline film or layer over a crystalline-based semiconductor surface or substrate. The deposited substance must have a definite acclimatization with regard to the crystal-based semiconductor substrate. Moreover, Chip developers applies either molten or vapor based foundations to produce such epitaxial over layers. An epitaxial wafer is a wafer of semiconducting substrate made by epitaxial growth for application in microelectronics, photovoltaics and photonics.
