Abstracts

The global Epoxy Resin Coated Mesh market size is expected to reach \$ 335 million by 2032, rising at a market growth of 5.2% CAGR during the forecast period (2026-2032).

Epoxy resin coated mesh refers to a metal mesh material made of low-carbon steel wire, stainless steel wire, aluminum wire, or other metal wire woven mesh as the substrate. After the mesh is formed, a surface protective layer is formed through processes such as epoxy resin powder spraying, electrostatic coating, and heat curing. It is also known as epoxy resin mesh or epoxy coated metal mesh. Its core function is not to directly undertake precision filtration, but to serve as a support layer for filter materials, a skeleton layer or a protective layer for filter cartridges, improving the stability of filter cartridge wrinkling, corrosion resistance, oil resistance and structural strength. In 2025, global Epoxy Resin Coated Mesh production reached approximately 146.92 M Sq m, with an average global market price of around US\$ 1.55 per Sq m. The annual production capacity of epoxy resin coated mesh is 190 M Sq m, with a gross profit margin of about 30%.

The online tour of epoxy resin coating mainly includes low-carbon steel wire, stainless steel wire, aluminum alloy wire, iron wire, epoxy resin powder, pigment, curing agent, coating additive, electrostatic spraying equipment, high-temperature curing furnace, leveling equipment, slitting equipment, punching molds and packaging materials. The typical production method is to weave ordinary steel wire, stainless steel wire or aluminum wire into a mesh, and then form a protective coating through electrostatic spraying and thermal curing of epoxy resin powder.

The downstream mainly includes hydraulic filter factories, air filter factories, oil filter factories, automotive filter factories, engineering machinery filter factories, air

compressor filter factories, industrial dust removal equipment factories, petrochemical fluid filtration system factories, aerospace filter component factories, and high-end equipment maintenance consumables enterprises.

Metal wires and metal mesh substrates account for about 45% to 60%, epoxy resin powders, pigments, and coating additives account for about 10% to 18%, weaving, warping, weaving, and pre-treatment processing account for about 8% to 13%, electrostatic spraying, curing, cooling, and coating testing account for about 7% to 12%, slitting, punching, winding, and customized processing account for about 5% to 10%, labor, energy, and equipment depreciation account for about 5% to 9%, packaging, warehousing, and transportation account for about 3% to 6%, and losses, rework, and quality control account for about 2% to 5%.

Epoxy resin coated mesh is a supporting consumable in industrial filtration materials, with demand mainly coming from hydraulic filters, air filters, oil filters, engineering machinery filters, automotive filters, air compressor filters, industrial dust removal, petrochemical fluid filtration, and high-end equipment maintenance markets. With the development of hydraulic systems towards high pressure, high precision, and long service life, filter cartridges not only require the stability of the filtering medium itself, but also require the support mesh to have good wrinkle support, coil flatness, coating adhesion, bending resistance, and corrosion resistance. Therefore, the competition focus of epoxy resin coated mesh is shifting from ordinary anti-corrosion coatings to filter cartridge processing adaptability. The future market opportunities will mainly focus on high-pressure hydraulic filter cartridges, construction machinery aftermarket, automotive filter upgrades, air filtration energy-saving renovations, long-life industrial filter cartridges, and customized products with stainless steel and aluminum substrates; But the industry will also face low-end homogenization competition, price fluctuations of steel wire and epoxy powder, increased requirements for environmentally friendly spraying, stricter control of coating thickness and edge burrs by customers, as well as pressure to replace plastic support nets, uncoated stainless steel nets, and composite filter material structures. Overall, enterprises with stable coating lines, precision cutting capabilities, narrow and long roll supply, low burr control, and customer verification experience in filter cartridges are more likely to obtain high-end orders and higher gross profit margins.
