Abstracts

The global Epoxy Resin Mesh market size is expected to reach \$ 335 million by 2032, rising at a market growth of 5.2% CAGR during the forecast period (2026-2032).

Epoxy resin mesh usually refers to an epoxy resin coated metal mesh formed by using low-carbon steel wire, stainless steel wire, aluminum wire or iron wire woven mesh as the substrate, and by electrostatic spraying, heat curing, slitting or punching of epoxy resin powder. It can also be called epoxy resin coated mesh or epoxy coated metal mesh. It is not an epoxy resin raw material, but a filtering support and protective material, mainly used for hydraulic filter cartridges, oil filter cartridges, air filter cartridges, pleated filter material support layers, industrial filter diaphragm support, and filter cartridge skeleton protection. In 2025, global Epoxy Resin Mesh production reached approximately 146.92 M Sq m, with an average global market price of around US\$ 1.55 per Sq m. The annual production capacity of epoxy resin network is 190 M Sq m, with a gross profit margin of about 30%.

The online tour of epoxy resin mainly includes low-carbon steel wire, stainless steel wire, aluminum alloy wire, iron wire, epoxy resin powder, pigment, curing agent, auxiliary agent, electrostatic spraying equipment, high-temperature curing furnace, leveling equipment, slitting equipment, punching molds, and packaging materials. The typical production method is to first weave metal wires into a mesh, and then form a uniform protective coating through electrostatic spraying of epoxy resin powder and high-temperature curing. Common substrates include ordinary steel mesh, aluminum alloy mesh, and stainless steel mesh.

The downstream mainly includes hydraulic filter factories, air filter factories, oil filter factories, automotive filter factories, engineering machinery filter factories, air

compressor filter factories, industrial dust removal and fluid filtration equipment factories, petrochemical filtration system factories, aerospace and high-end equipment maintenance consumables enterprises. The most common use of epoxy resin mesh is as a support layer for pleated filter cartridges, especially in providing strength, wrinkle stability, and anti-corrosion protection in hydraulic oil filtration.

Metal wires and metal mesh substrates account for about 45% to 60%, epoxy resin powders, pigments, and coating additives account for about 10% to 18%, weaving, warping, weaving, and pre-treatment processing account for about 8% to 13%, electrostatic spraying, curing, cooling, and coating testing account for about 7% to 12%, slitting, punching, winding, and customized processing account for about 5% to 10%, labor, energy, and equipment depreciation account for about 5% to 9%, packaging, warehousing, and transportation account for about 3% to 6%, and losses, rework, and quality control account for about 2% to 5%.

Epoxy resin mesh is a segmented supporting consumable in industrial filtration materials, with market demand mainly coming from hydraulic system filters, engineering machinery filters, automotive oil and air filters, air compressor filters, industrial dust removal, petrochemical fluid filtration, aerospace and high-end equipment maintenance consumables. With the increasing demand for filter reliability in engineering machinery, mining machinery, agricultural machinery, industrial hydraulic stations, and new energy vehicle thermal management and fluid control systems, the value of epoxy resin mesh is no longer limited to surface anti-corrosion of ordinary metal mesh, but is reflected in its wrinkle forming stability, coating adhesion, oil resistance, bending resistance, low burrs, coil flatness, and batch size consistency. The future industry opportunities mainly come from high-pressure hydraulic filters, long-life industrial filters, engineering machinery aftermarket, energy-saving air filtration, alternative imported filter material support nets, and customized slitting rolls; The challenges include homogenization of low-end products, price fluctuations of steel wire and epoxy powder, control of coating thickness, environmental spraying requirements, strict inspection of flatness and coating adhesion by export customers, as well as substitution competition brought by plastic support nets, uncoated stainless steel nets, and composite filter material structures. Overall, the epoxy resin mesh market will gradually upgrade from general black coated coils to high adhesion, oil and temperature resistance, narrow precision slitting, stainless steel substrates, aluminum substrates, and customized specifications for filter cartridges. Enterprises with stable coating, precision slitting, and customer verification capabilities for filter cartridges are more likely to obtain mid to high end orders.
