According to our (Global Info Research) latest study, the global Epoxy Underfill Adhesive market size was valued at US\$ 669 million in 2025 and is forecast to a readjusted size of US\$ 1440 million by 2032 with a CAGR of 11.7% during review period.

Epoxy underfill adhesive is a high-reliability insulating encapsulation material used in semiconductor packaging and board-level assembly. It is typically supplied as a one-component or pre-formulated heat-curable epoxy system in liquid or paste form, and after cure it forms a cross-linked polymer network. Functional fillers such as silica are often incorporated to optimize coefficient of thermal expansion, flow behavior, mechanical strength, and long-term reliability. The material fills the narrow gap between the chip and the substrate through capillary action or through no-flow and molded processes, creating stress redistribution and structural reinforcement around solder joints, bumps, and interconnects. Its main product categories include capillary underfill, no-flow underfill, and molded underfill, and its key applications cover flip chip, ball grid array, chip scale package, wafer level chip scale package, advanced packaging, automotive electronics, mobile devices, data center hardware, and high-performance computing.

In 2025, global epoxy underfill adhesive production reached approximately 320 to 520 tons. Based on publicly visible advanced packaging capacity expansion, rising demand from artificial intelligence and high-performance computing related packages, and commercial pricing samples for packaging-grade underfill materials, the representative free-on-board price generally ranged from about US\$900 to US\$2,600 per kilogram in 2025.

The global epoxy underfill adhesive market is moving rapidly from a conventional package protection material toward a critical reliability enabler for advanced semiconductor packaging. As artificial intelligence training and inference processors, high-bandwidth memory, chiplet architectures, and heterogeneous integration continue to scale, package structures are shifting toward larger body sizes, finer pitches, and higher thermal loads. This is raising material requirements for low voiding, fast and uniform flow, low coefficient of thermal expansion, high glass transition temperature, and high cleanliness. TSMC has repeatedly highlighted the importance of advanced packaging and three-dimensional stacking technologies for high-performance computing, while Amkor has also stated that high-performance computing and artificial intelligence are driving technology innovation and demand for advanced packaging. This means underfill is no longer merely a conventional assembly material, but an increasingly high-value solution tightly linked to package design, process compatibility, and customer qualification.

From a commercial perspective, growth is no longer driven solely by consumer electronics. It is increasingly supported by a broader mix of consumer electronics, data center infrastructure, artificial intelligence accelerators, automotive electronics, and high-reliability industrial electronics. In server processors, advanced memory packages, and automotive control modules, underfill plays a more critical role in thermal cycling endurance, drop performance, and long service life. At the same time, the market faces clear constraints. Finer pitch structures and thinner die designs require a more precise balance among rheology, filler loading, cure profile, flux compatibility, and reworkability. Long qualification cycles, strict consistency requirements, and high process sensitivity mean that competition is centered more on formulation know-how, field application support, and global delivery capability than on simple price competition. As international suppliers accelerate the development of new materials for large-body artificial-intelligence and high-performance-computing packages, the next phase of competition will increasingly focus on advanced packaging compatibility, automotive-grade reliability, and ecosystem alignment with leading outsourced assembly and test providers, integrated device manufacturers, and foundries.
