Abstracts

The global Equatorial Telescope Mounts market size is expected to reach \$ 77 million by 2029, rising at a market growth of 4.6% CAGR during the forecast period (2023-2029).

The equatorial telescope mount is made to improve the shortcomings of the horizon device. Its main purpose is to overcome the influence of the earth's rotation on stargazing. A set of standard astronomical telescopes often consists of telescopes, equatorial telescope brackets, tripods and other components. When the equatorial mount is used, its polar axis must first be aligned with the north celestial pole. (Ideally) After full alignment, the telescope is facing any star, and the declination does not need to be adjusted. It is only necessary to let the telescope rotate at a constant speed in the direction of right ascension (or hour angle) according to the speed of the stars. Keep the star in the field of view of the telescope at all times. The market for equatorial telescope mounts will grow as economic investment in astronomy education brings in more amateur astronomers.

An equatorial telescope mount is a mount for instruments that compensates for Earth's rotation by having one rotational axis, the polar axis, parallel to the Earth's axis of rotation. This type of mount is used for astronomical telescopes and cameras.

This report studies the global Equatorial Telescope Mounts production, demand, key manufacturers, and key regions.
