According to our (Global Info Research) latest study, the global Erbium-doped Fiber Laser Therapeutic Instrument market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Erbium-doped fiber laser therapeutic instruments are medical devices that use a type of laser called an erbium-doped fiber laser for therapeutic purposes. These lasers emit light at a wavelength of around 1,550 nanometers, which is absorbed by water in the tissue being treated. This causes the water to heat up and vaporize, creating a small hole or channel in the tissue. These instruments are commonly used for minimally invasive surgical procedures, such as endoscopic treatments for conditions like gastroesophageal reflux disease (GERD) and Barrett's esophagus. They can also be used for cosmetic procedures, such as skin resurfacing and wrinkle reduction. Erbium-doped fiber laser therapeutic instruments are generally considered safe and effective when used by trained medical professionals. However, as with any medical procedure, there are potential risks and complications associated with their use, which should be discussed with a healthcare provider before undergoing treatment.
