## Abstracts

The global Erbium-doped Fiber Laser Therapeutic Instrument market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Erbium-doped fiber laser therapeutic instruments are medical devices that use a type of laser called an erbium-doped fiber laser for therapeutic purposes. These lasers emit light at a wavelength of around 1,550 nanometers, which is absorbed by water in the tissue being treated. This causes the water to heat up and vaporize, creating a small hole or channel in the tissue. These instruments are commonly used for minimally invasive surgical procedures, such as endoscopic treatments for conditions like gastroesophageal reflux disease (GERD) and Barrett's esophagus. They can also be used for cosmetic procedures, such as skin resurfacing and wrinkle reduction. Erbium-doped fiber laser therapeutic instruments are generally considered safe and effective when used by trained medical professionals. However, as with any medical procedure, there are potential risks and complications associated with their use, which should be discussed with a healthcare provider before undergoing treatment.

This report studies the global Erbium-doped Fiber Laser Therapeutic Instrument production, demand, key manufacturers, and key regions.
