Abstracts

The global ESD Wheel market size is expected to reach \$ 362 million by 2032, rising at a market growth of 4.4% CAGR during the forecast period (2026-2032).

In 2025, global ESD Wheel production reached approximately 144.44 million units, with an average global market price of around US\$1.80 per unit.

The gross profit margin of major companies in the industry is between 22%-38%.

In 2025, the global production capacity of ESD Wheel was approximately 192.59 million units.

ESD Wheel is a conductive or static-dissipative wheel designed to reduce electrostatic buildup and protect sensitive electronic components, equipment, and cleanroom environments. It is commonly used in carts, trolleys, racks, workstations, medical equipment, semiconductor facilities, electronics manufacturing lines, and precision industrial handling systems.

The industrial chain of ESD Wheel covers upstream materials such as conductive rubber, polyurethane, carbon additives, metal cores, bearings, bushings, plastic hubs, fasteners, and molding tools. The midstream consists of material mixing, wheel molding, curing, machining, bearing assembly, conductivity testing, load testing, and packaging. Downstream applications mainly include electronics factories, semiconductor plants, cleanrooms, laboratories, medical facilities, logistics carts, industrial workstations, and precision manufacturing lines.

Electronics manufacturing, cleanroom workshops and semiconductor production

increase the application of ESD wheels. They effectively release static electricity to protect precision components from electrostatic damage. Wear-resistant and load-bearing design adapts to long-term clean-room handling operations.

This report studies the global ESD Wheel production, demand, key manufacturers, and key regions.
