Abstracts

The global eSIM Chip market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The eSIM chip refers to the SIM card insert into the device and updating its configuration through wireless remote download. Compared with the traditional pluggable SIM card, eSIM greatly reduces the card space on the device, and its volume is reduced to 10% of the traditional SIM card. In addition, it is directly embedded in the device in form, realizing the true card-free device, thus increasing the flexibility of product design; Its seismic resistance, high temperature resistance and reliability are stronger, and it can better adapt to the harsh working environment; Not bound to a specific operator and remote configuration support flexible switching of operator data to ensure fast and stable connection.

This report studies the global eSIM Chip production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for eSIM Chip, and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2022 as the base year.
