Abstracts

According to our (Global Info Research) latest study, the global Esophageal Stents market size was valued at USD 77 million in 2023 and is forecast to a readjusted size of USD 102.9 million by 2030 with a CAGR of 4.3% during review period.

Esophageal stent is a flexible mesh tube, which is placed in the constricted area of esophagus to enlarge the food passage for better digestion and absorption of nutrients. These stents are usually made of metal and are designed to expand the esophagus muscles. Some stents are made of silicone or plastic and are used in treating constricting tumors that occur in esophageal cancer. These stents are placed by using an endoscope through a patients' mouth and with X-ray guidance.

The introduction of advanced next-generation fully covered metallic stents is increasing the popularity of stenting procedures using self-expandable metal stent (SEMS). The demand for SEMS will continue to grow in the forthcoming years due to the rising prevalence of esophageal cancer such as esophageal adenocarcinoma and esophageal squamous cell carcinoma, esophageal stricture, tracheoesophageal fistula, and achalasia. The application of SEMS includes many benefits such as increased patency to prevent tissue ingrowth after the stenting procedure. This encourages a large number of vendors to manufacture SEMS over self-expandable plastic stent (SEPS).

The Global Info Research report includes an overview of the development of the Esophageal Stents industry chain, the market status of Hospitals (Self-expandable Metallic Stents (SEMS), Self-expanding Plastic Stents (SEPS)), Clinics (Self-expandable Metallic Stents (SEMS), Self-expanding Plastic Stents (SEPS)), and key enterprises in developed and developing market, and analysed the cutting-edge
