## Abstracts

Esophageal Temperature Management Device is a medical device used to monitor and regulate a patient's body temperature. This device usually consists of a specially designed probe or tube that is inserted into the patient's esophagus through the mouth or nose to monitor the patient's core body temperature. The Esophageal Temperature Management Device can help medical staff monitor changes in the patient's body temperature in real time and take appropriate cooling or warming measures when necessary to maintain the patient's normal body temperature range during surgery or other treatments.

This device is typically used in clinical situations that require long procedures, precise body temperature monitoring, and patient temperature management, such as cardiac surgery, neurosurgery, pediatric surgery, etc. With esophageal temperature management devices, medical staff can better control patients' body temperature, reduce the risk of infection, promote patient recovery, and improve surgical success rates.
