Abstracts

The erythrocyte sedimentation rate, also known as the ESR or sed rate, is a clinical lab test that measures the rate at which red blood cells in whole blood descend into a standardized tube, reported as mm per hour. It is often used to screen patients with fevers of undetermined origin, arthritides, muscle pains, and other vague symptoms. ESR testing is specifically indicated for certain conditions: to monitor rheumatoid arthritis, tuberculosis, and systemic lupus erythematosus; and to diagnose and monitor giant cell arteritis and polymyalgia rheumatica. An elevated ESR may also be associated with many other conditions, including other autoimmune disease, anemia, infection, and malignancy.

This report studies the global ESR Analyser production, demand, key manufacturers, and key regions.
