Abstracts

The global Ethyl 4-Bromobutyrate market size is expected to reach \$ 151 million by 2032, rising at a market growth of 3.6% CAGR during the forecast period (2026-2032).

Ethyl 4-bromobutyrate (CAS: 2969-81-5) is a colorless to yellow transparent liquid classified as an organic intermediate. In chemical synthesis, it primarily serves as a reagent for introducing the 4-bromobutyl group and is widely utilized in the synthesis of pharmaceuticals, agrochemicals, and fine chemicals. Due to the presence of a reactive bromine atom and an ester group within its structure, it is frequently employed in the preparation of heterocyclic compounds and heterocyclic-based pharmaceuticals.

The industry chain for ethyl 4-bromobutyrate illustrates a transition pathway from basic bulk chemicals to high value-added intermediates. Key upstream raw materials include γ -butyrolactone (GBL), hydrobromic acid or phosphorus tribromide, and anhydrous ethanol. Its synthesis typically employs a ring-opening esterification method, produced through the reaction of GBL with a brominating agent under acidic conditions.

Downstream applications are highly concentrated within the pharmaceutical industry.

In 2025, global sales volume is projected to reach approximately 8,500 tons, with an average selling price of \$13,500 per ton. The industry's gross profit margin ranges between 20% and 30%.

The core value of ethyl 4-bromobutyrate lies in the high reactivity of the bromine atom within its molecular structure and the versatility of its ester group, endowing it with exceptional reaction selectivity when constructing complex pharmaceutical side chains. As a key raw material for nootropics such as piracetam, ethyl 4-bromobutyrate stands to benefit from the expansion of the global market for drugs targeting neurodegenerative

diseases. As the global CDMO sector evolves toward greater efficiency and integration in 2026, downstream pharmaceutical companies' demand for this intermediate?specifically requiring high purity (exceeding 99%) and low impurity levels?is driving manufacturers to transition from extensive, mass-production models toward refined, precision-managed operations.
