Abstracts

The global Ethyl Chloroformate market size is expected to reach \$ 5.21 million by 2032, rising at a market growth of 3.9% CAGR during the forecast period (2026-2032).

Ethyl Chloroformate is an important organic synthesis intermediate, typically appearing as a brown liquid. It is insoluble in water but readily soluble in organic solvents. Its upstream supply chain relies on basic chemical raw materials, with key raw materials including phosgene (or alternative non-phosgene methods) and ethanol. The price and supply stability of these raw materials directly impact production costs.

In 2025, global sales are projected to be approximately 7,432 tons, with an average market price of approximately US\$5,224 per ton. The industry's gross profit margin is expected to be in the range of 15%-25%.

The ethyl chloroformate industry is a specialized chemicals sector characterized by stable demand but subject to strict regulations and environmental and safety constraints. While its market size is not large, it is indispensable in the pharmaceutical and agrochemical fields. Upgraded environmental and safety production standards present challenges but also drive technological advancements in the industry, forcing companies to invest in the research and development of greener and safer non-phosgene synthesis processes. This creates opportunities for differentiated competition for companies with strong technological innovation capabilities.

This report studies the global Ethyl Chloroformate production, demand, key manufacturers, and key regions.
