According to our (Global Info Research) latest study, the global Ethylene Oxide (EO) Residual Testing market size was valued at US\$ 790 million in 2024 and is forecast to a readjusted size of USD 1125 million by 2031 with a CAGR of 5.2% during review period.

Ethylene Oxide (EO) Residual Testing is a crucial process in various industries, especially in healthcare and medical device manufacturing. Ethylene oxide is commonly used as a sterilizing agent due to its effectiveness in killing a wide range of microorganisms. However, after the sterilization process, there may be residues of EO left on the sterilized products. These residues can potentially be harmful to patients and users if not properly monitored. EO Residual Testing involves the use of specific analytical methods and techniques to accurately measure the amount of EO remaining on or within the sterilized items. This ensures that the levels of EO residues are within the safe limits set by regulatory authorities. For example, in the medical field, before a sterilized surgical instrument is used on a patient, it must pass EO Residual Testing to guarantee patient safety. By conducting this testing, industries can maintain high - quality standards, protect public health, and comply with regulatory requirements related to the use of ethylene oxide in sterilization processes.
