The global EUV Film market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

EUV lithography is a cutting-edge technology in semiconductor manufacturing that utilizes extreme ultraviolet light to create smaller features on semiconductor wafers. It is a key technology for advancing semiconductor manufacturing processes. EUV lithography offers several advantages, including the ability to produce smaller feature sizes, higher resolution, and improved manufacturing efficiency. These advantages are crucial for keeping pace with Moore's Law and increasing the performance of microprocessors and memory chips.

EUV Film is a dust mask that protects the photomask pattern from foreign matter and helps to increase productivity in semiconductor manufacturing, especially for ultrafine semiconductors below 7nm. The film helps prevent foreign matter from being printed onto semiconductor wafers.
