Abstracts

The global EV Liquid-cooled Electric Drive System market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The EV Liquid-cooled Electric Drive System refers to a type of electric drive system used in electric vehicles (EVs) that utilizes a liquid cooling system to regulate the temperature of the electric motor and other components. The liquid cooling system in the EV Liquid-cooled Electric Drive System helps in maintaining the optimal temperature of the electric motor and power electronics. It circulates a coolant, usually a mixture of water and ethylene glycol, through channels or pipes that are in direct contact with the motor and electronics. This helps dissipate the heat generated during operation and prevents overheating, which can negatively impact the performance and lifespan of the components. By using a liquid cooling system, the EV drive system can operate more efficiently and reliably, as it can maintain a consistent temperature range. This allows the electric motor to deliver its maximum power output consistently, resulting in improved performance and longer component life. It also enables faster charging of the battery pack, as excessive heat generated during charging can be quickly dissipated.

This report studies the global EV Liquid-cooled Electric Drive System production, demand, key manufacturers, and key regions.
