Abstracts

The global EV Signalling Wire market size is expected to reach \$ 6247 million by 2032, rising at a market growth of 10.3% CAGR during the forecast period (2026-2032).

In the electrical architecture of an electric vehicle, the EV signalling wire acts as the essential 'nervous system' that facilitates the exchange of low-voltage data and control commands between various electronic control units (ECUs). Unlike high-voltage power cables that transmit energy to the motor, signalling wires carry critical information such as battery temperature, cell voltage, and throttle position. These wires often utilize twisted-pair or shielded designs to ensure signal integrity against electromagnetic interference (EMI) generated by the vehicle's high-power components. They are particularly crucial during the charging process, where they enable the communication 'handshake' between the vehicle and the charging station to regulate power flow and ensure safety.

In 2025, global EV Signalling Wire production reached approximately 1.5 billion meters, average price was 2 USD/meter, gross margin 20%.

This report studies the global EV Signalling Wire demand, key companies, and key regions.
