The global EV Traction Motor Bearings market size is expected to reach \$ 1485 million by 2032, rising at a market growth of 9.8% CAGR during the forecast period (2026-2032).

EV Traction Motor Bearings are high-precision components situated at both ends of the electric vehicle's rotor to support rotational motion and sustain mechanical loads. Unlike conventional industrial motors, traction motors in EVs demand bearings that can withstand ultra-high rotational speeds (often exceeding 15,000 to 20,000 RPM) and rapid acceleration. To mitigate the risk of electrical erosion caused by high-frequency switching in the inverter (EDM currents), these bearings often incorporate specialized features such as ceramic rolling elements (hybrid bearings) or insulating coatings. Key performance requirements include low frictional torque for range extension, superior high-temperature stability, and advanced sealing technologies to prevent lubricant leakage. In 2025, global EV Traction Motor Bearings production reached approximately 50 million units and average price was 15 usd/unit .

This report studies the global EV Traction Motor Bearings production, demand, key manufacturers, and key regions.
