According to our (Global Info Research) latest study, the global EVA / PE Foam Compression Forming Machine market size was valued at US\$ 74.59 million in 2025 and is forecast to a readjusted size of US\$ 120 million by 2032 with a CAGR of 6.7% during review period.

EVA (PE) compression foaming machines are specialized forming equipment primarily designed to process EVA, PE, and their modified foaming compounds. Through the combined effects of heating, pressure, and mold cavity control, these machines enable the materials to complete crosslinking, expansion, and shaping within the mold, thereby producing the intended final geometry. In essence, they belong to the category of hot-press foaming equipment.

Such equipment typically consists of a machine frame, hydraulic system, heating platen system, mold system, temperature and pressure control system, as well as loading/unloading and safety control units. Its core function is to ensure that, under stable temperature, pressure, and dwell-time conditions, the foaming material achieves a uniform cell structure, good dimensional stability, and the target density distribution within the mold cavity.

Downstream applications are concentrated mainly in footwear materials and footwear components, including insoles, midsoles, outsoles, slippers, sandals, and wedge parts. The equipment is also widely used in EVA/PE foamed boards and sheets, sports mats and protective products, industrial cushioning components, and certain irregular compression-molded products.

In 2025, global shipments of EVA (PE) compression foaming machines were approximately 1.4k units, with an average selling price of about US\$40,000 per unit.

The EVA (PE) compression foaming machine market is characterized by an Asia-led and footwear-led structure. Its core demand still comes from footwear materials and footwear components, especially midsoles, outsoles, insoles, and related molded parts, while adjacent applications include sports mats, protective pads, foam boards and sheets, wheels, cushioning parts, and selected industrial molded products. From a regional perspective, global footwear manufacturing remains highly concentrated in Asia: in 2024, Asia accounted for about 88% of global footwear production and 85.1% of export volume. This means that new equipment demand, replacement demand, and production-line relocation are still primarily concentrated in Asian manufacturing hubs such as China, Vietnam, Indonesia, and India. On the supply side, Taiwanese manufacturers maintain a visible position in EVA foaming and compression-molding equipment, with public materials highlighting footwear, sports materials, and EVA foam molding as core applications and indicating exports to multiple countries, which suggests a relatively mature regional equipment supply base.

From a market-driver perspective, the industry is mainly shaped by three forces. First, footwear order cycles and manufacturing relocation determine the overall volume of equipment demand. Second, machine-specification upgrades determine pricing tiers and competitive positioning, with clamping force, platen size, double-deck/double-station design, heating-and-cooling conversion, automation, and temperature-pressure control precision being the most important variables. Third, rising requirements for efficiency, energy saving, and process consistency are pushing the market from standard machines toward higher-spec models. Public case materials and product descriptions already position heating-cooling conversion, automated operation, energy saving, stable temperature control, and parallel multi-mold operation as core selling points. As a result, future market growth is unlikely to depend only on volume expansion; it will increasingly come from equipment upgrading within the footwear base market and gradual penetration into adjacent segments such as sports protection and industrial cushioning.
