Abstracts

An evaporative cooling fan is a type of fan that uses the process of evaporation to cool the air. These fans typically have a water reservoir that is used to moisten a cooling pad or filter. As the fan blows air through the moistened pad, the water evaporates, which helps to lower the temperature of the air passing through the fan. Evaporative cooling fans are often used in hot and dry climates where traditional air conditioning may not be as effective or cost-efficient. They are also more energy-efficient than traditional air conditioning units, making them a popular choice for cooling outdoor spaces or rooms with good ventilation. Overall, evaporative cooling fans can provide a cost-effective and environmentally friendly way to cool a space, especially in areas with low humidity levels.

According to our (Global Info Research) latest study, the global Evaporative Cooling Fan market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
