Abstracts

According to our (Global Info Research) latest study, the global Event Stream Processing market size was valued at USD 679.7 million in 2023 and is forecast to a readjusted size of USD 1963.6 million by 2030 with a CAGR of 16.4% during review period.

Event stream processing (ESP) platforms are software systems that perform real-time or near-real-time calculations on event data 'in motion.' The input is one or more event streams containing data about customer orders, insurance claims, bank deposits/withdrawals, tweets, Facebook postings, emails, financial or other markets, or sensor data from physical assets such as vehicles, mobile devices or machines. The platforms process the input data as it arrives (hence 'in motion'), before optionally storing it in some persistent store. They retain a relatively small working set of stream data in memory, just long enough to perform calculations on a set of recent data for the duration of a time window.
