Abstracts

According to our (Global Info Research) latest study, the global Event Stream Processing Software market size was valued at USD 1225 million in 2023 and is forecast to a readjusted size of USD 3340.2 million by 2030 with a CAGR of 15.4% during review period.

Event Stream Processing Software (ESPS) is a software solution that enables the processing and analysis of data streams in real time. Data streams are continuous flows of data from various sources, such as sensors, social media, transactions, market feeds, etc. ESPS allows users to apply complex event processing, stream analytics, stream data integration and other techniques to extract insights, detect patterns, monitor performance, trigger actions and more from the streaming data. ESPS differs from batch processing software, which focuses on historical data and requires storing the data before processing it. ESPS can handle unbounded and dynamic data and provide immediate responses to current situations.

The industry trend of ESPS is expected to be positive and growing in the coming years, as more organizations realize the benefits of optimizing their decision intelligence and real-time applications by tapping the growing availability of streaming data. Some of the factors that are influencing the evolution of ESPS are the adoption of cloud-based solutions, the integration of Internet of Things (IoT) devices and sensors, the use of artificial intelligence (AI) and machine learning (ML) algorithms, the implementation of contactless and automated processes, and the enhancement of data analytics and reporting capabilities.
